Maternal Mortality.—A subject of cognate interest with that of infantile mortality is the maternal mortality arising out of child-birth. This maternal mortality is shown by Table 31 to be at its lowest among mothers in their twenties, and to increase with mothers of more advanced years. The mortality among mothers of different ages per 1,000 living births to mothers at those ages in the eight provinces constituting the registration area for the years 1921 to 1925, is shown for the years 1921 to 1927, while the totals are given for all the provinces for 1926 and 1927. The maternal mortality is shown by age groups for 1927 and by totals for earlier years in Table 32, also by causes for 1927 in Table 33.

31.—Maternal Mortality in the Former Registration Area, by Age Groups, with Rates per 1,000 Living Births, 1921-1927, and Totals for all Provinces for 1926 and 1927.

NOTE.—1927 figures are subject to revision.
