Subsection 5.-Other Forest Industries.

Sawmills and pulp-mills draw their supplies of raw material direct from the forest in the form of logs and pulpwood, and produce sawn lumber, other sawmill products and pulp and paper. There are also a number of important industries which use these products as raw material for further manufacture. Some of them produce commodities made almost entirely of wood, wood pulp or paper, others manufacture articles in which wood is the most important component, and others produce articles in which wood is necessary but forms only a small proportion of the value. There are, in addition, a number of industries which use wood indirectly in the manufacture of articles which do not contain wood as a component part. The first class includes the manufacture of paper, sash, doors and other millwork and planing-mill products, boxes, baskets, cooperage and other containers, canoes, boats and small vessels, kitchen, bakers' and dairy woodenware, wooden pumps, piping, tanks and silos, spools, handles, dowels and turnery. The second class includes the manufacture of furniture, vehicles and vehicle supplies, coffins and caskets, etc., and the use of paper in printing and the manufacture of boxes, bags, stationery and paper goods.

The third class, where wood has a secondary importance, includes the manufacture of agricultural implements, railway rolling stock, musical instruments, brooms and brushes, etc.

The fourth class could be said to include practically every form of industrial activity, as few, if any, of these are entirely independent of the use of wood, directly or indirectly.

Subsection 6.—Summary of Forest Utilization.

A classification based on the chief component material in the products of each manufacturing establishment is now largely used in comparing manufacturing industries and for external trade classification. Under this system most of the forest industries fall in the wood and paper group. In 1926 the gross value of production for all classes of manufactured products amounted to \$3,247,803,438, of which total the wood and paper group contributed \$600,064,661 or about 18 p.c. It was exceeded in this respect by the vegetable products with 20 p.c. and followed by the iron and steel group with 16 p.c. of the total. Of the nine groups of industries into which the industrial census is divided, the wood and paper group, which includes the manufacture of lumber, pulp and paper as well as the wood and paper-using industries, heads the lists in number of establishments with 6,751, in capital invested with \$929,589,278, in total number of employees with 134,185 and in salary and wage distribution with \$260,916,729.

In few industries does manufacture add a higher percentage to the value of raw material used than in the wood and paper-using industries; in the manufacture of pulp and paper this percentage is 252 and in the lumber industry, 171. By the manufacture of lumber into planing-mill products the value is increased by a further 191 p.c. For the wood and paper group as a whole the net value of production or the value added by manufacture in 1926 was \$339,062,685, or 130 p.c. of the value of raw materials used. In this respect the wood and paper group of industries also surpasses all the other groups of manufactures. Further details are given in the Manufactures chapter on pp. 416 and 417 of the present volume.
