

and Alberta ranked fourth with \$29,309,223. Quebec was fifth with \$28,870,403 and Manitoba, New Brunswick, Yukon Territory and Saskatchewan followed in the order named, with productions of from \$2,888,912 down to \$1,455,225. The record of the respective provinces from 1899 on is given in Table 4.

4.—Mineral Production of Canada, by Provinces, calendar years 1899-1928.

¹Includes a small production from Prince Edward Island.

*Figures for 1928 are subject to revision.

The quantities and values of the minerals produced in each province during 1927 are shown in Table 5. Coal accounts for 90 p.c. of the value of mineral production in Nova Scotia, with gypsum the item of next importance. Coal and gypsum are also the most important mineral products of New Brunswick, which is one of the three provinces of the Dominion with a production of natural gas and petroleum. Quebec is the only province in which asbestos is produced, and in 1927 this was her principal mineral. Other important minerals of Quebec are cement, stone and other structural materials, zinc, silver, copper, lead, gold and magnesite. Gold represented 37 p.c. of the value of Ontario's mineral production in 1927, and with other metals, of which nickel, silver, copper and cobalt are the chief, made up nearly 70 p.c. of the total for the province. As the most populous province, Ontario has a large production of the various structural materials, and there is also a large production of natural gas and of salt. Aside from cement and other structural materials, gypsum is the principal mineral product of Manitoba. Saskatchewan's mineral production is small and coal constitutes more than half the total. Coal is
