¹ Includes imports of foreign cheese together with stocks of other varieties of whole milk cheese which are excluded from the cheddar cheese estimate. ² Except concentrated milk products; see footnote 3. ³ As quantities of whole and skim milk are not separable, converting factors cannot be used.

Subsection 5.—Horticulture

The annual statistics of commercial horticulture are confined to the production and value of fruits, flowers and nursery stock. While no attempt is at present made to estimate the annual production of vegetables, Volume VIII—Agriculture—of the 1931 Census shows in detail the production, acreage and value of the most common vegetable crops. The processing of fruits and vegetables is closely allied to the production industry. In 1940, the latest year for which figures are available, the value of processed fruit (including wine) and vegetables was \$57,023,000.

Fruit Production.—Apple growing is the mainstay of the fruit industry in Canada, the value of commercial production averaging about \$10,000,000 annually.
