A comparison of the two life tables reflects the great improvement in mortality which has taken place during the 10-year period. This is conspicuous in respect of both males and females.

Male mortality is heavier at all ages, but particularly so among infants of 0-1 year; 62 out of every 1,000 boys born die before 1 year of age, but only 49 out of every 1,000 girls. The life expectation in this period is less than at age 1. Males who have passed through the hazardous first year may look forward to 66 years of life and females to 69 years. Expectation of life of a boy who reaches working age, say 15, is 54 years, and of a girl 56 years. At age 25, a common age of marriage, it is 45 years for males and 47 for females. At age 70, when people become eligible for
