

of 63.5 before turning upward again. Irregular recovery then continued until 1937, but the highest point reached, 87.6 in July, 1937, was substantially below the 1926 average. The collapse of the wheat market in 1938, along with fairly general depression in other markets, carried wholesale price levels just prior to the outbreak of war in 1939 down to about eleven points above the 1913 level. The August, 1939, index of 72.3 marked the extreme low of a two-year decline. The movement

of prices prior to the outbreak of the War of 1939-45 was quite different, therefore, from that which preceded the War of 1914-18. The relatively low level of prices in August, 1939, probably influenced the sharper initial advance at the outbreak of war. However, during 1940 price levels steadied and showed no sign of a steep increase until 1941. By that time, great expansion in wartime production had made serious inroads into stocks of nearly all basic commodities and, at the end of 1941, wheat remained the only important commodity for which stocks exceeded predictable requirements. The introduction of general price control in December, 1941, followed a year in which wholesale prices had advanced 11.0 p.c. as compared with 3.1 p.c. in 1940. The effectiveness of control is indicated by the fact that percentage increases in wholesale prices amounted to only 3.7 and 5.7 for the years 1942 and 1943, respectively, while the December, 1944, index remained the same as the December, 1943, figure. The December, 1945, index of 103.9 was 11.1 p.c. above that for December, 1941, when price control became generally effective. By that time, the gradual removal of wartime price controls had been commenced.
