Table 24 summarizes the life expectancy figures extracted from the Canadian Life Tables for 1931, 1941, 1951 and 1956. Life expectancy at birth increased for men from 60 in 1931 to over 67.6 years in 1956 and from 62 to 72.9 years for women during the same period. This is a gain for males of 1.3 years since 1951 compared with gains of 3 and 3.3 years in the previous decades; females gained 2.1 years since 1951 compared with 4.2 and 4.5 years in the preceding decades. Thus, since 1931 a total of 7.6 years have been added to male life expectancy and female longevity has been lengthened by 10.8 years.

The increases in life expectancy have been predominantly at the younger ages, particularly in infancy, and diminish with advanced age. For example, since 1931, 3.2 years have been added to the life expectancy of a five-year-old male, 2.1 years to a 20-year-old, over 8 months to a 40-year-old and just over two months to a 60-year-old as compared with 7.6 years for a newborn male. During this period life expectancy for a five-year-old female gained 7.2 years; for a 20-year-old 6.0 years, 3.7 years for a 40-year-old and 2.1 years for a 60-year-old as compared with 10.8 years for a newborn female.
