<sup>1</sup> As at the 1956 Census; residents only.

<sup>2</sup> By place of occurrence.

<sup>3</sup> Per 1,000 live births.

### Section 2.—Births\*

The Canadian birth rate in 1921 was 29 per 1,000 population. As a rate of 35 is very high for countries of modern western civilization, the Canadian rate had probably not fallen far, nor for long, before 1921. It fell continuously until 1937 when it reached a low of 20.1 but, as a result of economic recovery and the War, it rose to 21.6 in 1940, 24.3 in 1945 and 28.9 in 1947, the highest since 1921. From 1948 to 1959 it fluctuated between 27.1 and 28.5 but in 1960 stood at 26.9, the lowest since 1946.

The birth rates in most provinces followed similar trends but there were some regional differences in the birth rate pattern in recent years. Although all provinces had record high rates immediately following World War II, average birth rates in Ontario and the western provinces were higher during 1951-55 than for the 1946-50 period, while those for Quebec and the Maritimes were lower. In fact, Ontario, British Columbia and Alberta had record high crude birth rates during the 1956-59 period. However, all provincial birth rates declined or remained stationary between 1959 and 1960.

\* Unless otherwise indicated, "births" in this Section refers to infants born *alive*; stillbirths are dealt with under a separate heading on p. 194 and under multiple births on p. 190. For international comparisons, see Section 7, pp. 214-215.
