The amounts and percentages of domestic and imported coal apparently consumed in Canada in the years 1952-61 are shown in Table 26. The imports represent amounts taken out of bond for consumption during the respective years, regardless of when received. Thus the totals are exclusive of coal landed at Canadian ports and re-exported or ex-warehoused for ships' stores without being taken out of bond. However, since such coal while remaining in bond at the port is available for Canadian consumption if required, the total amount of coal made available for consumption in Canada in 1961 amounted to 21,669,560 tons, including 985,217 tons of anthracite, 17,114,562 tons of bituminous, 1,360,930 tons of subbituminous, and 2,208,851 tons of lignite.

¹ The sum of Canadian coal mines' sales, colliery consumption, coal supplied to employees and coal used in making coke, etc., less the tonnage of coal exported. ² Imports of briquettes are not included in this table but are shown separately in Table 24. ³ Includes small tonnages from countries other than Britain and the United States. Deductions have been made from this column to take account of foreign coal re-exported from Canada and bituminous coal ex-warehoused for ships' stores.

Petroleum.—The upward climb of crude petroleum production in evidence since the discovery of the Leduc field in Alberta in 1947 halted temporarily in 1958 but resumed in 1959 and continued in 1960 and 1961. Production in the latter year reached a record level, 16.3 p.c. above the previous peak in 1960. The increase in 1961 over 1960 was mainly accounted for by a more than 27,000,000-bbl. increase in Alberta.
