**Uranium.**—Uranium mineralization has been found in Canada at intervals along the western and southern edges of the Canadian Shield but production has been concentrated in four areas within this belt—Great Bear Lake in the Northwest Territories, Beaverlodge in northern Saskatchewan, and Elliot Lake and Bancroft in Ontario. Although output of uranium first began in the Northwest Territories in 1942, figures were not available until 1954 because of government restrictions. However, it was after that time that the large mines and mills of Saskatchewan and Ontario came into production. Peak output amounting to 31,800,000 lb. was reached in 1959 from 23 mines, but by the end of 1964, for economic reasons (see p. 557), only five mines remained in operation and production dropped to about 13,800,000 lb. for the year. Of the 1964 quantity, 87 p.c. was produced in Ontario and the remainder in Saskatchewan.

16.—Quantity and Value of Producers' Shipments of Uranium (U<sub>3</sub>O<sub>8</sub>), by Province, 1955-64
