

No. 9 shaft at International Nickel's Creighton mine in the Sudbury district of Ontario will reach its maximum depth of 7,150 feet early in 1969. It is one of two new shafts being sunk at the Company's operating mines. Five new mines in the Sudbury district and three new mines at Thompson, Man., together with general expansion of processing facilities will increase the Company's Canadian annual nickel production capability by 100,000,000 to 150,000,000 lb. by 1970.
