¹ Exclusive of the Territories for which adequate information is not available. ² Mental hospitals only; does not include psychiatric or mental units in general hospitals. ³ Tuberculosis hospitals only; does not include tuberculosis units in general hospitals. ⁴ Includes payments for services to patients.

Diagnoses of Patients in Mental Institutions and Tuberculosis Sanatoria.—

Tables 13 and 14 summarize the most recent data available on diagnoses according to age and sex of patients on the books of mental institutions and tuberculosis sanatoria, including patients in related units located in general hospitals.

Of the 75,617 mentally ill patients under care on Dec. 31, 1959, detailed information is available for 73,047. Of these, 63.6 p.c. had been diagnosed as psychotic, 32.7 p.c. as mentally defective or otherwise affected by character, behaviour and intelligence disorders, and 2.7 p.c. psychoneurotic. More of the male than the female sex had been institutionalized for disorders of character, behaviour and intelligence, with the largest frequency of both sexes occurring in the 10-19 age group. Similarly, more male than female cases (except of persons 70 years of age or over) had been diagnosed as psychotic. However, in all age groups, nearly twice as many women as men had required hospitalization for conditions diagnosed as psychoneurotic.

13.—Diagnoses of Patients on the Books of Reporting Mental Hospitals, by Age and Sex, 1959

NOTE.—Figures include patients in 78 mental hospitals and also patients in psychiatric and mental units in general hospitals.
